

Descriptives

Caroline Ledbetter

There were 9947 observations for 695 unique subjects. The number of observations for each subject ranged from 1 to 18 with an average of 14.31 observations (Fig 1). Characteristics for study participants are given in Table 1. To confirm random assignment, categorical variables were tested using χ^2 and continuous variables were tested using ANOVA. p-values are shown in Table 1.
